

Project Plan – Marketing Copy Workflow Assistant for Skincare Startups

1. Project Title

Marketing Copy Workflow Assistant for Skincare Startups

2. Target User, Workflow, and Business Value

Target User: A junior social media coordinator at a direct-to-consumer skincare startup.

Current Workflow: Receives product launch briefs and manually drafts captions for Instagram and TikTok.

Workflow Boundaries: Begins when a product brief is received and ends when approved captions are ready to publish.

Pain Points: Slow drafting, inconsistent tone, limited team capacity, weak copy may reduce campaign results.

Business Value: Faster launches, better engagement, stronger click-through and conversion performance.

3. Problem Statement and GenAI Fit

Exact Task: Convert one structured product brief into several publish-ready captions and compare which option is strongest.

Why This Fits Language Models: Requires persuasive writing, tone shifting, and multiple alternatives quickly.

Why Simpler Tools Are Not Enough: Templates often sound repetitive and generic.

4. Planned System Design and Baseline

Step 1 – User Input: product name, benefits, target audience, campaign objective, platform.

Step 2 – Multi-Version Generation: trendy short-form, premium skincare tone, emotional self-care tone.

Step 3 – Deterministic Tools: character counter, claim checker, CTA detector, similarity checker.

Step 4 – Evaluation Layer: relevance, platform fit, clarity, persuasiveness, then recommend one option.

Course Concept 1 – Prompt Engineering: prompts specify audience, tone, CTA style, banned claims.

Course Concept 2 – Tool Use: deterministic checks handled by tools instead of language models.

Baseline: current manual drafting and manager review.

Planned App: Streamlit interface showing three options, warnings, scores, and recommended best version.

5. Evaluation Plan

Success Looks Like: stronger captions created faster than manual workflow.

Metrics: relevance, platform fit, clarity, persuasiveness (1–5), generation time, revisions needed.

Test Set: 15–20 synthetic skincare briefs such as vitamin C serum, acne patch, SPF mist.

Comparison Method: manual drafting versus proposed multi-version workflow.

6. Example Inputs and Failure Cases

Example Inputs: TikTok acne patch campaign; Instagram premium night cream launch; summer SPF campaign.

Failure Cases: unrealistic claims, forced trendy tone, captions too generic, outputs too similar.

7. Risks and Governance

Risks: exaggerating benefits or overpromising results.

Should Not Be Trusted For: medical claims or regulatory decisions.

Controls: banned phrase checker, human approval before publishing, warning labels.

Cost Concern: limit generation to three outputs per request.

8. Plan for the Week 6 Check-in

Working Streamlit interface, generation complete, tools complete, ten evaluation cases tested, first baseline comparison results.
